-i- SUBUNIT: Heterodimer of an alpha and a beta subunit. Alpha-D associates with beta-2 (By similarity).
-i- SUBCELLULAR LOCATION: Type I membrane protein (By similarity) bowalin. The integrin I-domain (insert) is a VWFA domain. Integrin Location in the standard classer of the standard contains of the integrin alpha chain family.
-i- SIMILARITY: Contains 1 FG-Gap repeats.
-i- SIMILARITY: Contains 1 VWFA domain.

```
and 17) the short NC3 XIIB forms become the major forms. As the short NC3 forms become the major product, the long splice variant continues to be expressed in several tissues, even after birth. The long NC1 isoforms, XIIA-1 and XIIB-1, peak in 15-day old embryos and decrease in 17-day old ones. The expression of the short NC1 form XIIB-2 remains constant throughout late stages of embryonic development (ED15 and ED17).

-i- pTM: The triple-helical tail is stabilized by disulfide bonds at each end (By similarity).
```

-i- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains (By similarity).

-i- PTM: O-glycosylation of isoform XIIA-2; glycosaminoglycan of

-!- PTM: O-glycosylation of isoform XIIA-2; glycosaminoglycan of chondroltin-sulfate type (By similarity).

-- SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.

"Experimental support for a beta-propeller domain in integrin alph subunits and a calcium binding site on its lower surface.";

Proc. Natl. Acad. Sci. U.S.A. 95:4870-4875(1998).

-I- FUNCTION: Integrin alpha-M/beta-2 is implicated in various adhesive interactions of monocytes, macrophages and granulocyte as well as in mediating the uptake of complement-coated particl It is identical with CR-3, the receptor for the iG3b fragment the third complement component. It probably recognizes the R-C-peptide in C3b. Integrin alpha-M/beta-2 is also a receptor for fibrinogen, factor X and ICAM1. It recognizes P1 and P2 peptide of fibrinogen gamma chain.
                                                                                                                                                                                                                                                                                                      3D-STRUCTURE MODELING OF 17-616.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as a lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches 181;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

Also described sare: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising mature human TANGO197, thrombin cleavage site and his tag that can be used to treat exposure to or prevent a symptom of anthrax.

The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in forensic biology, for diagnostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range of cellular disorders can be treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid sequences encoding TANGO-1 and 239 polypeptides useful for the treatment arthritis, psoriasis and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                     Human anthrax toxin receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                     र्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC as a human anthrax toxin receptor (ATR) polypeptide on the basis of CC identity to a newly isolated human ATR (see ABP54903). The 2 polypeptides CC are identical between amino acids 1-317, but differ thereafter at the C-CC terminus. The present polypeptide, encoded by IMAGE CLONE 4563020, has no CC previously known function, and there has been no prior indication that it C is a complete or partial ATR. The invention provides ATR polypeptides and CC polynucleotides, vectors, host cells, and transgenic and knock-out CC animals. It also provides methods for identifying molecules that bind the CC ATR and which reduce the toxicity of anthrax toxin. A claimed method for treating anthrax in a human or animal involves administering an agent CC treating anthrax in a human or animal involves administering an agent CC agents include the present polypeptide or a PA-binding fragment of it, a monoclonal or polyclonal antibody, a polysaccharide, a fusion protein,

The polypeptide of the invention demonstrates antibacterial activities whilst the composition and method may be useful in preventing or ameliorating the symptoms of cutaneous and/or inhalation anthrax. The current sequence is that of the human TANGO 197 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (ROTT/) ROTTMAN J B.

Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a human von Willebrand factor A-like domain (vWF) amino acid sequence TANGO197.

The invention relates to a novel fusion polypeptide comprising a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous to the vWF. The polypeptide of the invention demonstrates antibacterial activities whilst the composition and method may be useful in preventing or ameliorating the symptoms of cutaneous and/or inhalation anthrax. The current sequence is that of the human TANGO 197 FLAG fusion protein of the invention.

Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197 and FLAG that can be used to treat exposure to or prevent a symptom of anthrax.

The polypeptide of the invention demonstrates antibacterial activities whilst the composition and method may be useful in preventing or ameliorating the symptoms of cutaneous and/or inhalation anthrax. The current sequence is that of the human TANGO 197 HiaTag fusion protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a fusion polypeptide comprising a von Willebrand factor A-like domain (VWF) amino acid sequence and an amino acid sequence heterologous to the VWF. Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197, thrombin cleavage site and his tag that can be used to treat exposure to or prevent a symptom of anthrax.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New TANGO 197 and/or TANGO 216 fusion polypeptides for preventing or ameliorating symptoms of anthrax comprises a von Willebrand factor A-like domain (VWF) amino acid sequence and an amino acid sequence heterologous

It also provides methods for identifying molecules that bind the ATR and which reduce the toxicity of anthrax toxin. A claimed method for treating anthrax in a human or animal involves administering an agent that inhibits binding between PA and ATR at a level effective to reduce the severity of anthrax. Suitable agents include ATR or a PA-binding fragment of ATR, a PA-binding polypeptide at least 80% identical to these, a fusion protein, a monoclonal or polyclonal antibody, a polysaccharide, a lipid or a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
```

```
New TANGO 197 and/or TANGO 216 fusion polypeptides for preventing or ameliorating symptoms of anthrax comprises a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous to the vWF.
                                                                                                                                                                 A-like
```

Claim 44; SEQ ID NO 10; 64pp; English.

heterologous to the vWF. Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197 extracellular region, minus the DG residues closest to the transmembrane region, and The invention factor A-like G237A. describes a fusion polypeptide comprising domain (vWF) amino acid sequence and an an Q (IgG) fragment of crystallisation (Fc) with mutations amino acid sequence a von Willebrand

Sequence 384 AA;

The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. acquired haematopoietic disorders, meural disorders (e.g. Alzheimer's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Albumin fusion protein; therapeutic protein X; human albumin; HA human serum albumin; HSA; cancer; reproductive disorder; digestive disorder; immune disorder; endocrine disorder; haematopoietic disorder; neural disorder; connective disorder; cytostatic; antiinfertility; antiinflammatory; antiulcer; immunomodulator; anti-HIV; antidiabetic; haemostatic; nootropic;
                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New fusion protein for treating disease e.g. diabetes comprises albumin fused to a therapeutic protein. % \label{eq:comprise}
